## Table des matières

### 1 ILP optimization (4.1)

#### On as fait les modifications :

Pour ssandPile\_do\_tile\_opt() on a retirer les appelles à table(out, i, j) pour passer par une varaible intermedier result. Cette modification petmer au compilateur de vectoriser car il peut maintenet facilement voir que les différante lige peuve être calculer en paralelle.

```
int ssandPile_do_tile_opt(int x, int y, int width, int height)
      int \ diff = 0;
      for (int i = y; i < y + height; i++)
        for (int j = x; j < x + width; j++)
           table(out, i, j) = table(in, i, j) % 4;
          int result = table(in, i, j) % 4;
          table(out, i, j) += table(in, i + 1, j) / 4;
10
11
          result += table(in, i + 1, j) / 4;
12
          table(out, i, j) += table(in, i - 1, j) / 4;
13
          result += table(in, i - 1, j) / 4;
14
          table(out, i, j) += table(in, i, j + 1) / 4;
15
          result += table(in, i, j + 1) / 4;
          table(out, i, j) += table(in, i, j - 1) / 4;
16
          result += table(in, i, j - 1) / 4;
17
          if (table(out, i, j) >= 4)
18
           table(out, i, j) = result;
19
           if (result >= 4)
20
            diff = 1;
21
22
23
24
      return diff;
```

```
int ssandPile_do_tile_opt(int x, int y, int width, int height)
{
    int diff = 0;
    for (int i = y; i < y + height; i++)
        for (int j = x; j < x + width; j++)
        {
        int result = table(in, i, j) % 4;
        result += table(in, i + 1, j) / 4;
        result += table(in, i, j + 1) / 4;
        result += table(in, i, j + 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, j - 1) / 4;
        result += table(in, i, i - 1) / 4;
        result
```

Le gain de performance est de 2.37 car  $\frac{178812}{75408}$ 

#### Pour asandPile\_do\_tile\_opt() on a retirer...

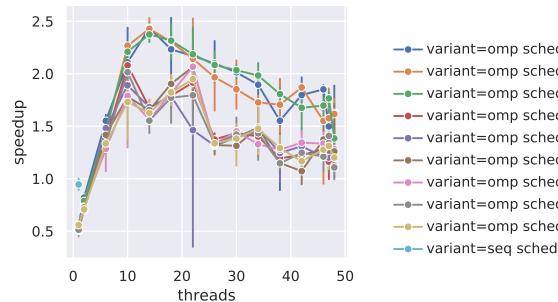

```
int asandPile_do_tile_default(int x, int y, int width, int height)
      int change = 0;
      for (int i = y; i < y + height; i++)
        for (int j = x; j < x + width; j++)
           if (atable(i, j) >= 4)
           int result = atable(i, j);
           if (result >= 4)
             result/=4;
11
             atable(i, j - 1) += atable(i, j) / 4;
             atable(i, j - 1) += result;
             atable(i, j + 1) += atable(i, j) / 4;
15
             atable(i, j + 1) += result;
             atable(i - 1, j) += atable(i, j) / 4;
             atable(i - 1, j) += result;
17
             atable(i + 1, j) += atable(i, j) / 4;
18
            atable(i + 1, j) += result;
19
            atable(i, j) %= 4;
20
            change = 1;
21
22
23
      return change;
    }
24
```

```
atable(i, j - 1) += result;
atable(i, j + 1) += result;
atable(i - 1, j) += result;
atable(i + 1, j) += result;
atable(i, j) %= 4;
change = 1;
}
return change;
}
```

Le gain de performance est de 1.2 car  $\frac{37990}{31405}$
